

Novel Coronavirus (2019-nCoV) Public Information

Background

In late December 2019, the People's Republic of China reported an outbreak of pneumonia due to unknown cause in Wuhan City, Hubei Province.

In early January 2020, the cause of the outbreak was identified as a new coronavirus, named novel coronavirus (2019-nCoV). While early cases were likely infected by an animal source in a seafood and livestock market in Wuhan, ongoing human-to-human transmission is now occurring.

There are a number of coronaviruses that are transmitted from human-to-human. The most common of these are not of public health concern. However, 2019-nCoV can cause respiratory illness of varying severity and though the majority will have mild symptoms it can also cause severe illness. Currently, there is no vaccine and no specific treatment for those infected with the virus.

This information sheet contains links to advice for the public on what the novel coronavirus (2019-nCoV) is, who is at risk, and what you can do to prevent infection.

General Information

If you do not have symptoms and are looking for general information, a free helpline has been set up on 0800 028 2816.
